

FILTER UNITS FOR CENTRALIZED VACUUM SYSTEMS

The filtering units are filter groups complete with container and frame on wheels for easy handling. Equipped with star filter, they are suitable to separate materials even very fine. They are a good solution to collect the sucked product into a container which is separated from the vacuum cleaner so to protect the primary filter of the vacuum cleaner or to avoid possible material contamination. The container, placed under the filter, is easy to remove thanks to a release system and the capacity is therefore bigger than the previous listed filtering chambers, where the filter is inside the container itself. For all models it is possible to add as an option an absolute filter and they are available in painted steel or in stainless steel.
